

Specialists in driven piling and foundation engineering

 **VolkerGround Engineering**

 **VolkerWessels UK**

VolkerWessels is one of the largest construction groups in Europe, employing 16,000 people. The organisation has a turnover of €4.7 billion through its network of 120 operating companies throughout the world.

VolkerGround Engineering is a contractor specialising in the design, supply and installation of all forms of driven piling and foundation engineering. Our in-house team of experienced construction professionals, make the company what it is today.

From our north west base we operate throughout the United Kingdom in all industry sectors. All experienced construction professionals, we are passionate about our work and company and pride ourselves on finding tailored solutions for the most complex or simple of projects.

As part of one of the largest construction groups in Europe, VolkerWessels, we have access to the technical resources and innovations of companies working throughout the world. This includes our sister companies within the UK, with whom we form VolkerWessels UK.

Together we share best practice and skills, harness talent and improve delivery to clients. VolkerGround Engineering is the only specialist in the steel driven piling sector that has the financial strength of an international parent that provides confidence and security for all clients.

## Experience

After 40 years of continuous operation we have completed in excess of 1,000 projects for over 400 clients in all sectors of the industry including; developers, main contractors, house builders and government bodies.

Where complex solutions are needed we can adapt our geotechnical processes to suit your particular requirements, even customising equipment to complete solutions efficiently and economically.

As a leader within our industry we recognise the importance of our client's aspirations and work to find solutions to meet and exceed these. VolkerGround Engineering is committed to partnering and believe this to be a vital part of our working relationships with our clients.

## Capabilities

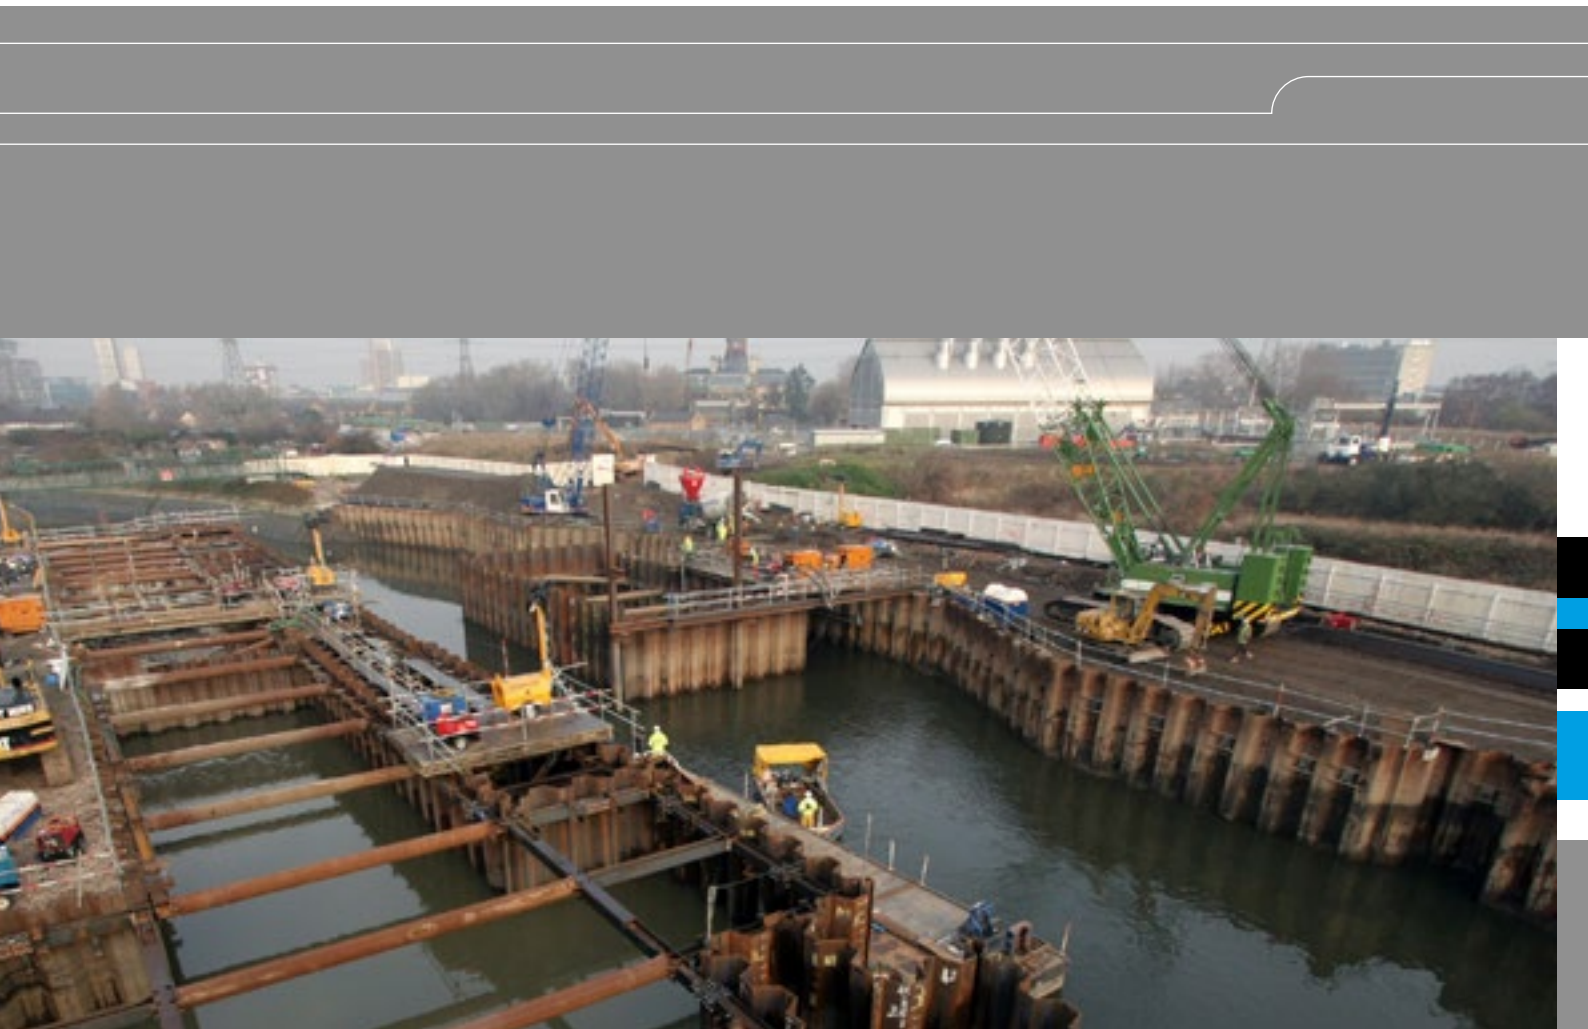

VolkerGround Engineering, together with sister company VolkerBrooks, own and operate an extensive selection of plant. This enables us to offer piling operations either on land or over water using the Linkflote pontoon system.

Our modern fleet of ABI integrated leader system rigs and variety of driving attachments allows us to install driven piles in the most demanding environments with minimum noise and vibration. Where development space is at a premium, such as inner city sites, we are able to customise our equipment to suit. Within environmentally sensitive locations, where noise and vibration would be unacceptable, we offer sheet pile installation and extraction using hydraulic pile presses.

Whether infrastructure or building, marine or industrial, the company is able to provide experience and add value. For the more specialised rail environment, VolkerGround Engineering is now also able to provide foundation solutions, either in possession or working track side, with the versatile Movax piling equipment.

We pride ourselves on our approachable business ethic and our technical ability, which ensure that our services are delivered to the highest quality with respect for people and the environment.

The health and safety of all our employees, suppliers and the general public is our highest priority. We are proud that our health and safety record is better than the piling industry average, but we are not complacent and are continually seeking ways to improve. Our Health and Safety Management Systems and behavioural safety campaigns make it easier for our employees and suppliers to adhere to our procedures whether on site or in an office.

## Environment and community

All our business activities are based on the fundamental principle of respect for people and the environment. Our environmental track record is among the best in the industry and we are committed to its continual improvement. Our Environmental Management System is certified to ISO 14001 certification.

We continue to work with our clients to develop new ways of working on construction sites to encourage the use of sustainable methods and materials, as well as delivering end products which in themselves are sustainable. The steel piles we source and use are manufactured in electric arc furnaces and made from 100% recycled material.

The company believes that it is our responsibility to promote and develop the next generation of industry employees. Together with our parent company VolkerStevin, we achieve this through graduate and engineering training programmes and by sourcing local employment where possible, as well as working with schools and universities near our head office.
